

Mobile Sales Analytics Dashboard

1. Introduction

This project is a Mobile Sales Analytics Dashboard created in Power BI. The main purpose of the project is to understand mobile sales performance using different business metrics and visualizations.

The dashboard makes it easier to see sales trends, compare brands and mobile models, understand payment methods, and check sales performance over different time periods.

2. Project Objectives

The main objectives of this project are:

- To understand overall mobile sales performance.
- To track important sales KPIs.
- To compare sales between different brands and mobile models.
- To analyze monthly and yearly sales trends.
- To understand customer payment preferences.
- To analyze customer ratings.
- To compare current sales with the previous year's performance.
- To present the analysis through an interactive Power BI dashboard.

3. Tools Used

- Power BI
- Power Query
- DAX
- Custom Calendar Table
- Data Visualization

4. Dashboard Pages

Page 1 – Executive Overview

This page gives an overall view of the sales data.

It includes:

- Total Sales
- Total Quantity
- Total Transactions
- Average Price
- Sales by City
- Sales by Brand
- Sales by Mobile Model
- Monthly Sales/Quantity
- Payment Method Analysis
- Customer Ratings
- Day-wise Sales

Page 2 – MTD Report

The second page focuses on Month-to-Date (MTD) sales.

It helps to understand how sales are progressing during the month and provides a detailed view of sales over time.

Page 3 – SPLY Report

The third page compares the current sales with Same Period Last Year (SPLY).

It includes yearly, quarterly, and monthly comparisons to understand changes in sales performance.

5. Key KPIs

KPI	Value
Total Sales	769M
Total Quantity	19K
Transactions	3.8K
Average Price	40.11K

6. DAX Used

I created DAX measures to make the dashboard interactive and support time-based analysis.

Some of the main functions used are:

- SUMX – used for calculations across rows.
- TOTALMTD – used to calculate Month-to-Date sales.
- SAMEPERIODLASTYEAR – used to compare sales with the same period from the previous year.

I also created a Custom Calendar table to support the date-based analysis.

7. Key Insights

From the dashboard analysis:

- Apple recorded the highest sales among the brands, at around 161.6M.
- iPhone SE was the top-grossing mobile model.
- The major payment methods had a fairly balanced distribution.
- Sales changed across different months and periods, which helped in understanding sales trends.
- The SPLY analysis makes it easier to compare sales performance with the previous year.

8. Conclusion

This project helped me get more practical experience with Power BI, DAX, data modeling, time intelligence, KPI creation, and data visualization.

The dashboard provides a simple way to explore mobile sales data and understand the main factors affecting sales performance.
